

Root Veggies

Root veggies are not all from the same plant family, but all are edible taproots that grow underground.

Edible roots come in many sizes, shapes, and colors. They all provide fiber and are a great way to add color to your plate.

In addition to steaming, baking or roasting, these root veggies can also be thinly sliced and enjoyed in their raw forms.

Radishes and beets are harvested in the spring; carrots are harvested in Georgia from December through June.

Carrots are one of the newest and most popular crops in the Georgia vegetable industry.

Beets and radishes are not known for their commercial production in GA but they are a popular choice for school gardens.

Many claim that these root vegetables are sweeter when Georgia grown because of our climate.
